www.southernanesthesia.com

Adverse reactions, anaphylactic shock - even cardiac arrest - are real threats facing today's sedation dentists.

In most critical situations veins collapse, rendering IV establishment difficult or impossible. Just waiting on EMS may be too late.

Be prepared with EZ-IO! The battery-powered driver is a simple, secure, immediate solution to establish vascular access in less than ten seconds.*

- Simple to use for both pediatric and adult patients
- Stable and secure line for patients with sudden respiratory distress or cardiac arrest
- Drug delivery equivalent to a central line even in CPR patients
- Relatively painless insertion, equivalent to placement of a peripheral IV without local anesthesia, allowing for use in alert patients
- Deliver any drug or fluid through the intraosseous (IO) route
- Easily placed by sedation dentists in patients that require immediate access, to continue critical drug infusions
- Extremely low complication rate
- Needle sets sterilized for 4 years, fully self contained driver available for approximately 1,000+ uses

*based on 95% of prior emergencies using EZ-IO®
